Coditu — Client Landing Playbook (Germany)

Oct 10, 2026 · @Abdelramhman

We win by showing each lead a working demo built for them before they ever talk to us, and by letting AI do the research so Adam only spends time on real conversations.

Flagship offer: the App Baukasten

Our strongest product is the kit we built for EVIM: staff sketch what they need on paper, pick building blocks, and get a working app in 1-3 days. EVIM already runs 6 or more apps from it, and we may show it with their name: EVIM Apps.

How it works:

1. **UI library:** React components based on shadcn, in the client's own design, that plug together like Lego.
2. **Login:** Microsoft Entra sign-in. Each person sees only what their Microsoft permissions allow.
3. **Backend:** our own Python modules for Entra app permissions, the SharePoint API and Microsoft Graph, behind a reverse proxy.
4. **Hosting:** on the client's own server and intranet domains, so data never leaves their house.

What EVIM uses it for: forms and requests, approvals, dashboards, and directories.

Apps EVIM uses today:

App	What it does	Type
Anfrage ("Gemeinsam besser")	Staff request consulting, process analysis or digitalisation help	Form and request
Onboarding Bildung	Onboarding process for new hires in the education department	Workflow
News-Redaktion	View, create, edit and publish EVIM news posts	Content management
Redaktionskalender	Weekly editorial planning	Planning

App	What it does	Type
Baukasten	The catalogue of building blocks staff choose from	Kit

Each of these is a ready demo for another organisation with the same need: a request desk, an onboarding flow, a news editor, an editorial calendar.

Why it sells:

- Departments get apps without starting an IT project.
- IT keeps control, because login, permissions and hosting stay with them.
- The engine is ours. For a new client we change the theme and connect their Microsoft tenant.
- The pitch fits in one German line: "Sie wählen die Bausteine. Wir bauen Ihre App."

Best demo for a lead: re-theme the kit in their colours and turn one PDF form from their website into a working app.

The core move: demo before the call

Other agencies send a pitch. We send something that already works, with the lead's own logo, colours and content. With Claude Code this costs us hours, not days, which is why competitors will not copy it.

Lead type	Free demo we build	Built from
Social and care organisations on Microsoft 365	2 web parts styled as their intranet, such as news and link tiles	Our EVIM component set, re-themed
Manufacturers	A RAG assistant answering questions from their public manuals or catalogues	Our RAG pipeline plus their public PDFs
Any SME with a weak website	1 rebuilt page, with before and after speed scores	Next.js template plus their content
Agencies and Microsoft partners	A short test task done in 48 hours	Whatever they are short on

Rules for the demo:

- Only for the best 3-5 leads each week. The rest get a lighter audit.
- Host it on a private link and record a 60-90 second German video walking through it.
- Use only public material from the lead. Never log in to anything of theirs.
- Cap it at half a day. If it takes longer, the template needs work, not the lead.

Weekly rhythm

The week is built around 25 new contacts, with scripts doing the finding and Adam doing the talking.

1. **Every day, automatic:** the daily Claude task and our scripts add new leads to Notion with a signal, a source link and a fit score.
2. **Monday:** Adam picks the best 25. The top 3-5 are marked for a personal demo.
3. **Monday to Wednesday:** the team builds the demos with Claude Code. The other 20 get an automated one-page audit.
4. **Tuesday to Thursday:** Adam sends connection requests and letters, and posts once or twice on LinkedIn.
5. **Friday:** follow-ups, then a 20-minute review of what got replies. Claude updates the scoring and the message templates from the results.

Targets to test in month one: 25 contacts a week, 3-5 replies, 1-2 calls. Adjust after four weeks of real numbers.

AI and scripts to build

Nine small tools, all within the 50 EUR monthly budget. Build them in this order.

#	Tool	What it does	Built with
1	Job-ad radar	Checks German job ads daily for SharePoint, SPFx, Intranet and Microsoft 365. A company hiring for these has the need and the budget now.	n8n cron, the public Jobsuche API of the federal employment agency, Claude API to classify, Notion API

#	Tool	What it does	Built with
2	Lead brief writer	For each new lead: a 5-line brief, the hook, a German opener in Sie form and a video script.	Daily Claude scheduled task writing to Notion
3	Site audit bot	Runs speed, mobile and SEO checks on a lead's site and writes a one-page German audit as PDF.	Google PageSpeed Insights API, headless screenshot, Claude API
4	Demo generator	Input a company URL. It pulls logo, colours and recent news from the public site, themes our web parts or a Next.js page, and deploys a private preview.	Claude Code custom command, our component set, Vercel previews
5	Public-docs RAG demo	Downloads a lead's public PDFs such as manuals and catalogues, indexes them, and serves a chat page that answers in German with page references.	Our RAG pipeline, Pinecone or pgvector free tier
6	Platform watcher	Reads project alerts from Malt, freelancermap and GULP, scores the fit, and drafts a German proposal within the hour.	Email alerts into n8n, Claude API
7	Proposal kit	Turns call notes into a German offer: scope, out of scope, milestones, fixed price.	Claude skill with our offer template
8	Call helper	Prep brief before a call. After it: summary, next steps, follow-up message and Notion update.	Claude with the call transcript
9	Results review	Weekly numbers per segment and per hook, with suggested changes.	Notion database plus a weekly Claude task

Limits we keep:

- AI researches and drafts. A person reads and sends every message.
- No LinkedIn or XING automation or scraping. It breaks their terms and gets accounts restricted.
- Only public pages and public APIs, at a polite request rate.

Smart ideas to get ahead

Ten moves, ordered by expected payoff.

1. **Use the EVIM network first.** Social organisations know each other. Ask the EVIM contact for a quote and three warm introductions. A referral beats any cold message.
2. **Treat hiring as a buying signal.** Filling a SharePoint developer role takes months. Offer to cover the gap now, starting with the free demo.
3. **Send a letter with a QR code.** A printed letter to the head of IT, linking to their personal demo. Postal mail is allowed where cold email is not, and almost nobody does it.
4. **Build an agency bench.** Find five Microsoft partners with open SPFx jobs and offer a paid 48-hour test task. One agency can send steady work for years.
5. **Mention funding.** Bavarian SMEs with up to 249 staff can apply for the Digitalbonus.Bayern grant, which runs until the end of 2027. Other states have their own programmes. A project that is partly funded is easier to approve.
6. **Open-source two web parts.** Publish generic versions on GitHub and to the PnP community samples, with a German README. Agencies and IT leads searching for SPFx will find us.
7. **Own narrow German searches.** One landing page each for terms like "SPFx Entwickler" and "SharePoint Webparts entwickeln lassen", each showing the EVIM work.
8. **Post the builds.** Adam posts one short before-and-after video a week using demo data. Cold contacts who have seen a post reply more often.
9. **Go where the buyers are.** Microsoft 365 and SharePoint community meetups in Berlin, where Adam is based, and social-sector fairs such as ConSozial in Nuremberg. Check dates first.
10. **Promise speed in writing.** Reply in 24 hours, demo in 72 hours, first working increment in one week. Put it on the site and keep it.

Outreach rules in Germany

Cold email is not allowed in Germany without prior consent, even between businesses, so email becomes a follow-up channel only. This changes the channel list in the vision brief.

Channel	Status	How we use it
Cold email	Needs prior express consent, also B2B	Only after they replied, met us, or filled in a form
Phone	B2B only with a concrete presumed interest	Not used for now
LinkedIn and XING messages	Grey area; courts can treat them like email	Connect first, keep the first message personal and not salesy, one person at a time
Letter by post	Allowed unless the recipient objected	Top leads, with a QR code to their demo
Posts, landing pages, events, referrals, platform bids	Fine	The main engines

- Keep only business contact details in Notion, note where each came from, and delete on request.
- This is not legal advice. The local IHK gives guidance on advertising rules. Source: IHK München.

Offers and pricing hooks

Sell named packages with a fixed price, and take payment only after the first working delivery. Prices below are starting suggestions to adjust.

Package	What the client gets	Time	Suggested price
Baukasten Setup	UI library in their design, Microsoft login, backend modules on their server, first 2 apps	2-3 weeks	8k-12k EUR
App on request	One more app from a sketch	1-3 days	From 600 EUR per app

Package	What the client gets	Time	Suggested price
Intranet web part pack	5 themed SharePoint web parts	3 weeks	5k-8k EUR
RAG pilot	An assistant over one document set, with sources shown	2 weeks	5k-8k EUR
Agency bench	SPFx or frontend developers by the day	Flexible	Day rate

- **Pay on milestone:** nothing is due until the first working increment is accepted. Protect it with a written scope, small milestones, and acceptance within 5 working days.
- **The free demo is milestone zero.** If they like it, it becomes the first paid piece.
- **Charge apps per piece, not per hour.** EVIM pays hourly today. When an app takes 1-3 days, hourly billing punishes us for being fast.
- **Maintenance:** per request, as agreed.

Notion pipeline

One leads database in Notion that scripts write to and Adam works from.

Stages: New, Qualified, Demo building, Contacted, Replied, Call booked, Proposal sent, Won, Lost, Later.

Field	Purpose
Organisation, city, sector, staff count	Who they are
Segment	Social and care, manufacturing, agency, startup
Signal and source link	Why they are a lead, with proof
Fit score	Set by Claude, corrected by Adam
Contact role and name	Public business details only
Offer and hook	Which package and which opener we used
Demo link	The private preview, if built
Channel, last touch, next step	So nothing is forgotten

First 14 days

Week 1, foundations:

- [ ] Ask the EVIM contact for a written quote, reference permission and three introductions.
- [ ] Make a neutral Baukasten demo with a fictional brand, plus a 90-second German video.
- [ ] Put the site on our own domain with a German page, Impressum and Datenschutz.
- [ ] Add the Baukasten and the security architecture to the portfolio as a case study.
- [ ] Create the Notion leads database.
- [ ] Turn on the daily Claude lead task.
- [ ] Sort out a SharePoint demo tenant. The free Microsoft 365 developer sandbox is no longer given to every account, so we may need one paid business licence.

Week 2, first outreach:

- [ ] Build the job-ad radar and the site audit bot.
- [ ] Build the demo generator as a Claude Code command.
- [ ] Adam: German LinkedIn and XING profiles, and the first two posts about the Baukasten.
- [ ] Contact the first 25 leads, with 3 personal demos.
- [ ] Publish the first open-source web part.
- [ ] Friday review of replies, then adjust.
